## **Matrix problems**

### 1. Suppose

$$A = \begin{bmatrix} 1 & 1 & 3 \\ 5 & 2 & 6 \\ -2 & -1 & -3 \end{bmatrix}$$

- (a) Check that  $A^3 = \mathbf{0}$
- (b) Replace the third column of A by the sum of the second and third columns

#### First, produce A

```
A <- matrix(c(1,1,3,5,2,6,-2,-1,-3), nrow = 3, byrow = TRUE)

## [,1] [,2] [,3]

## [1,] 1 1 3

## [2,] 5 2 6

## [3,] -2 -1 -3
```

Then, add the columns 2 and 3 and assign the sum to the third column

```
A[,3] <- A[,2] + A[,3]

A

## [,1] [,2] [,3]

## [1,] 1 1 4

## [2,] 5 2 8

## [3,] -2 -1 -4
```

### 2. Create the following matrix B with 15 rows

$$B = \begin{bmatrix} 10 & -10 & 10 \\ 10 & -10 & 10 \\ \dots & \dots & \dots \\ 10 & -10 & 10 \end{bmatrix}$$

Calculate the 3x3 matrix  $B^TB$ . You can make this calculation with the function crossprod(). See the documentaion.

```
B <- matrix(c(10, -10, 10), ncol = 3, nrow = 15)
crossprod(B)

## [,1] [,2] [,3]
## [1,] 1500 1500 1500
## [2,] 1500 1500 1500
## [3,] 1500 1500 1500</pre>
```

# 3. Create a 6 x 6 matrix matE with every element equal to 0. check what the functions row() and col() return when applied to matE.

Now, create the 6 x 6 matix:

$$\begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

Here is matE, a 6x6 matrix of 0's followed by row(matE) and col(matE)

```
matE <- matrix(rep(0,36), nrow = 6, byrow = TRUE)</pre>
# Note what the functions row() and col() do
row(matE)

6. Solve the following system of linear equations by setting up and solving the matrix equation Ax = y.

$$x_1 + 2x_2 + 3x_3 + 4x_4 + 5x_5 = 7$$
  
 $2x_1 + x_2 + 2x_3 + 3x_4 + 4x_5 = -1$ 

```
3x_1 + 2x_2 + x_3 + 2x_4 + 3x_5 = -3
4x_1 + 3x_2 + 2x_3 + x_4 + 2x_5 = 5
5x_1 + 4x_2 + 3x_3 + 2x_4 + x_5 = 17
y \leftarrow c(7, -1, -3, 5, 17)
mat \leftarrow matrix(0, nrow = 5, ncol = 5)
mat <- abs(col(mat) - row(mat)) + 1</pre>
solve(mat)%*%y

             2
## [4,]
## [5,]
```

7. Create a 6 x 10 matrix of random integers chosen from 1,2,...,10 by executing the following two lines of code:

```
set.seed(75)
aMat <- matrix(sample(10, size=60, replace=TRUE), nr=6)
set.seed(75)
aMat <- matrix(sample(10, size=60, replace=TRUE), nr=6)</pre>
```

Use the matrix you have created to answer these questions:

(a) Find the number of entries in each row which are greater than 4.

```
temp <- function(num) {
   sum(num > 4)
}
apply(aMat, 1, temp)
## [1] 4 7 6 2 6 7
```

(b) Which rows contain exactly two occurrences of the number seven?

```
temp2 <- function(num) {
   sum(num == 7) == 2
}
which(apply(aMat, 1, temp2))
## [1] 5</pre>
```

(c) Find those pairs of columns whose total (over both columns) is greater tnan 75. The answer should be a matrix with two columns; so, for example, the row (1,2) in the output matrix means that the sum of columns 1 and 2 in the original matrix is greater than 75. Repeating a column is permitted; so, for exalmple, the final output matrix could contain the rows (1,2), (2,1), and (2,2).

```
pairs <- colSums(aMat)
cbind(rep(1:10, rep(10,10)), rep(1:10,10))[outer(pairs,pairs,'+') > 75,]
```

```
[,1] [,2]
## [1,]
          2
          2
               6
## [2,]
## [3,]
          2
              8
## [4,]
          6 2
## [5,]
         6 8
              2
## [6,]
          8
## [7,]
          8
               6
          8
               8
## [8,]
```

What if repetitions are not permitted? Then only (1,2) from (1,2),(2,1) and (2,2) would be permitted.

```
pairs <- colSums(aMat)
x <- (outer(pairs,pairs,'+')>75)
x[lower.tri(x)] <- F
which(x,arr.ind = T)

## row col
## [1,] 2 2
## [2,] 2 6
## [3,] 2 8
## [4,] 6 8
## [5,] 8 8</pre>
```

#### 8. Calculate

(a) 
$$\sum_{i=1}^{20} \sum_{j=1}^{5} \frac{i^4}{(3+j)}$$

```
sum((1:20)^4) * sum(1/(3+(1:5)))
## [1] 639215.3
# or
sum(outer((1:20)^4, (3+(1:5)), "/"))
## [1] 639215.3
```

```
(b) \sum_{i=1}^{20} \sum_{j=1}^{5} \frac{i^4}{(3+ij)}

sum((1:20)^4 / (3 + outer(1:20,1:5,'*')))

## [1] 89912.02

(c) \sum_{i=1}^{10} \sum_{j=1}^{i} \frac{i^4}{(3+ij)}

temp < - function(x, y) { (x >= y) * x^4 / (3 + x * y)}
```

```
}
sum(outer(1:10,1:10,temp))
## [1] 6944.743
```
